Modeling phytoplankton traits, trade-offs and biogeography

- Biogeography: Who lives where?
- Why do they live there?
- What traits are important?

Model dominant type biogeography
Movie credit: Oliver Jahn, MIT

Modeling phytoplankton traits, trade-offs and biogeography

- Biogeography: Who lives where?

- Why do they live there?

- What traits are important?

Model needs “trait” information, but also can help us explore the importance of traits

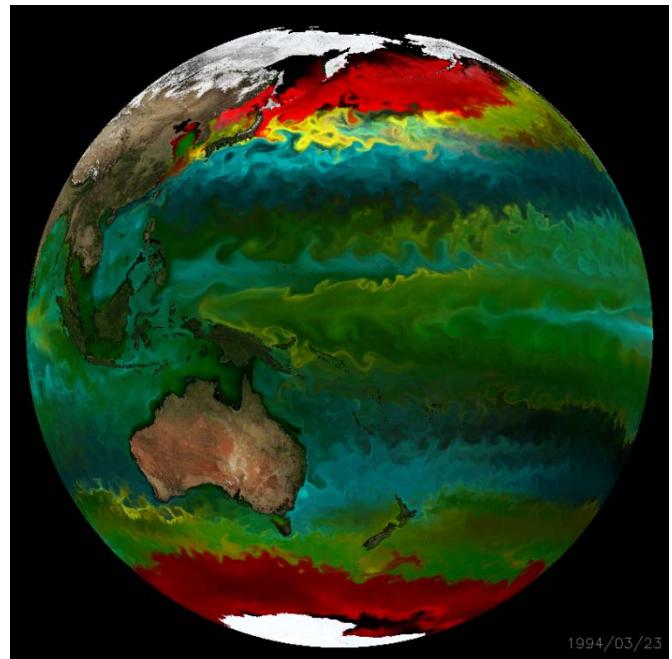

Modeling phytoplankton traits, trade-offs and biogeography

- What traits are important? (Are all traits created equally?)

OUTLINE OF REST OF TALK:

- Introduction to *Prochlorococcus*
- Introduction to model framework
- Series of experiments exploring different traits individually
- Some speculation

Model “functional” biogeography
green/blue: picoplankton;
red/yellow: large
Movie credit: Oliver Jahn, MIT

Prochlorococcus

- cyanobacterium
- one of the most abundant (in terms of cells)
- “model” organism = well studied

HOW DOES SIZE IMPACT PROCHLOROCOCCUS BIOGEOGRAPHY?

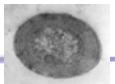

TRAITS

- small
- unique pigments
- N acquisition
- warm adapted

BIOGEOGRAPHY:

- Low latitudes
- Warm waters
- Low nitrate

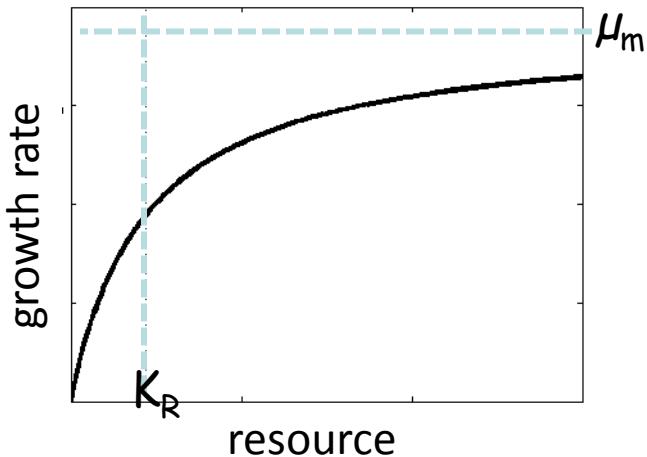

HOW DOES SIZE IMPACT PROCHLOROCOCCUS BIOGEOGRAPHY?

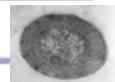

resources limited growth

$$\mu_m \frac{R}{R + K_R} P$$

R resource (nutrient, N, Fe, P, Si)
 P phytoplankton biomass

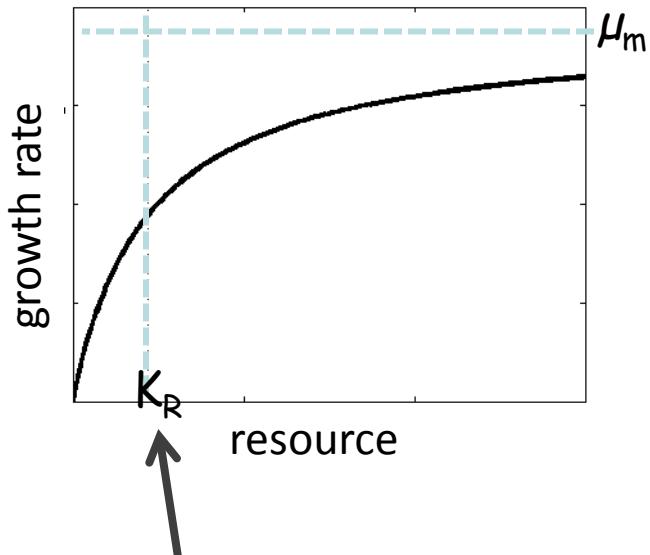

HOW DOES SIZE IMPACT PROCHLOROCOCCUS BIOGEOGRAPHY?

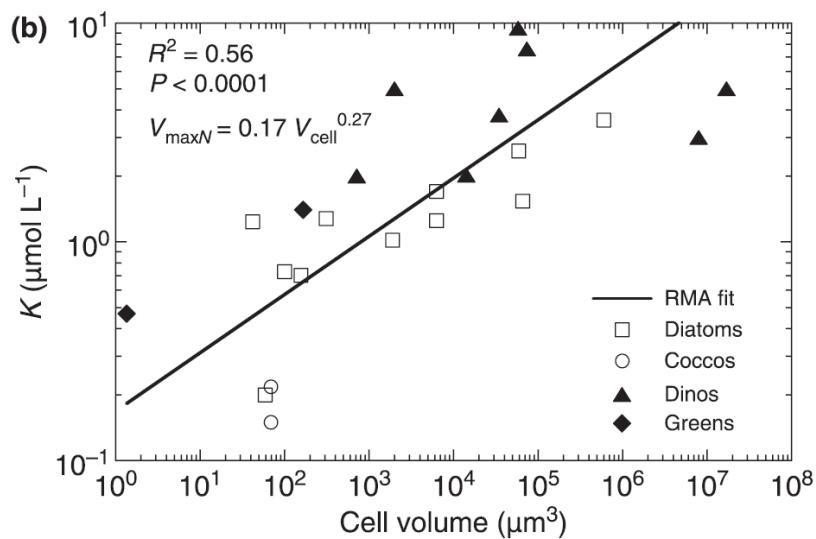

resources limited growth

$$\mu_m \frac{R}{R + K_R} P$$

small leads to lower K_R
(see e.g. Aksnes and Egge, MEPS 1991)

R resource (nutrient, N, Fe, P, Si)
 P phytoplankton biomass

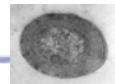

Litchman et al,
Ecol Lett., 2007

Massachusetts Institute of Technology

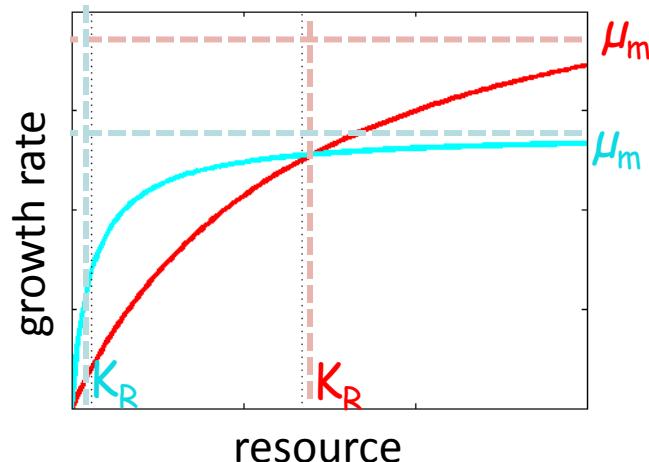

HOW DOES SIZE IMPACT PROCHLOROCOCCUS BIOGEOGRAPHY?

resources limited growth

$$\mu_m \frac{R}{R + K_R} P$$

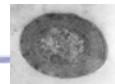

R resource (nutrient, N, Fe, P, Si)
 P phytoplankton biomass

r-strategy (opportunist),
grow fast, but require high
nutrients

K-strategy (gleaner), grow
slowly, but grow better at
low nutrients

HOW DOES SIZE IMPACT PROCHLOROCOCCUS BIOGEOGRAPHY?

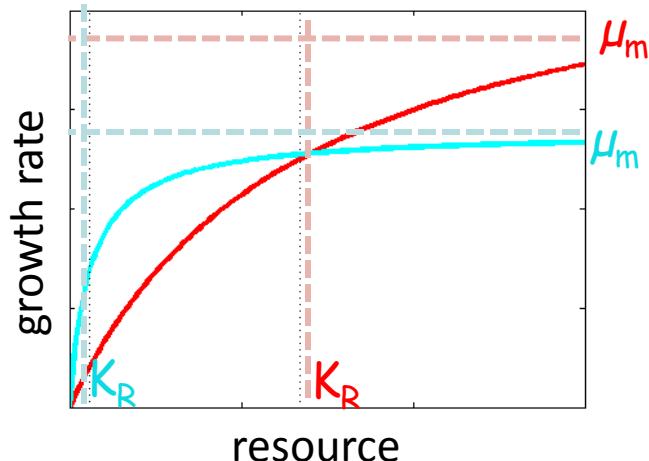

rate change = growth - loss

$$\frac{dP}{dt} = \mu_m \frac{R}{R + \kappa_R} P - MP$$

R resource (nutrient, N, Fe, P, Si)

P phytoplankton biomass

$M(Z, w, m)$ loss (grazing, sinking, etc)

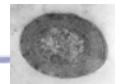

r-strategy (opportunist),
grow fast, but require high
nutrients

K-strategy (gleaner), grow
slowly, but grow better at
low nutrients

Massachusetts Institute of Technology

HOW DOES SIZE IMPACT PROCHLOROCOCCUS BIOGEOGRAPHY?

rate change = growth - loss

$$\frac{dP}{dt} = \mu_m \frac{R}{R + K_R} P - MP$$

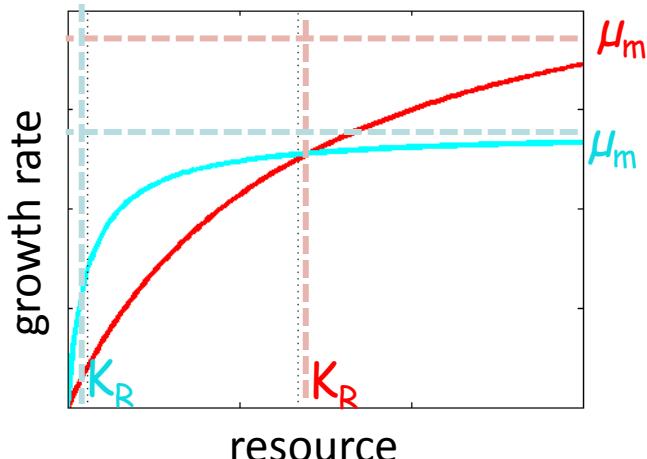

STEADY STATE:

$$R^* = \frac{\kappa_R M}{\mu_m - M}$$

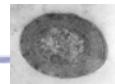

phytoplankton with
lowest R^* favoured

Resource
Competition Theory
(Tilman, 1977)

R resource (nutrient, N, Fe, P, Si)
 P phytoplankton biomass
 $M(Z, w, m)$ loss (grazing, sinking, etc)

HOW DOES SIZE IMPACT PROCHLOROCOCCUS BIOGEOGRAPHY?

rate change = growth - loss

$$\frac{dP}{dt} = \mu_m \frac{R}{R + K_R} P - MP$$

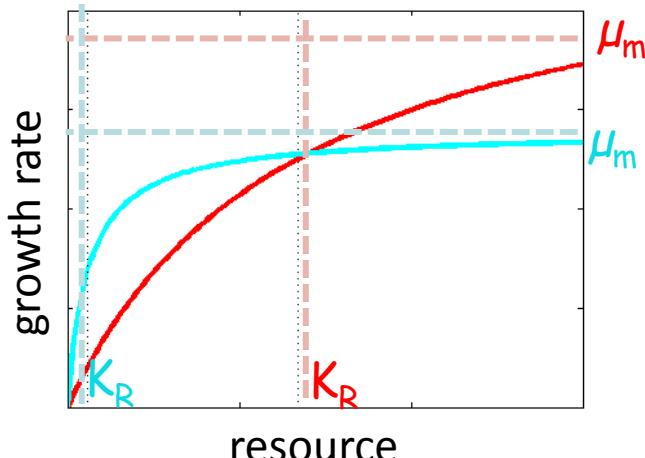

STEADY STATE:

$$R^* = \frac{\kappa_R M}{\mu_m - M}$$

phytoplankton with
lowest R^* favoured

Resource
Competition Theory
(Tilman, 1977)

R resource (nutrient, N, Fe, P, Si)
 P phytoplankton biomass
 $M(Z, w, m)$ loss (grazing, sinking, etc)

If $R^* < R^*$, gleaner wins in
steady state conditions

Only warm water adapted clades survive since no stable, low nutrient, cold regions.

(see e.g. Follows et al, Science, 2010)

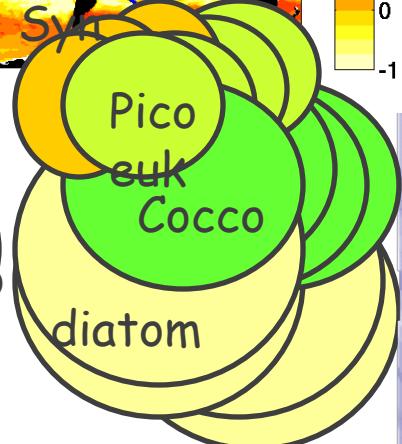

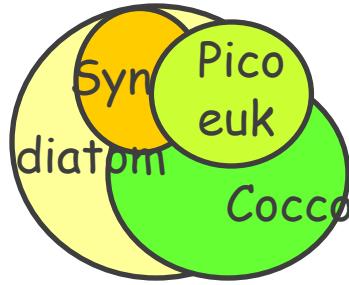

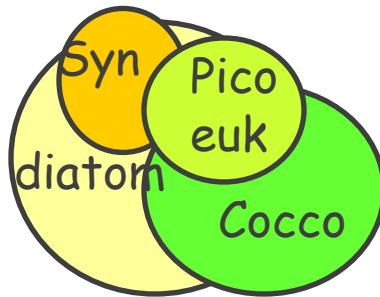

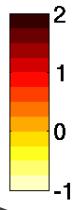

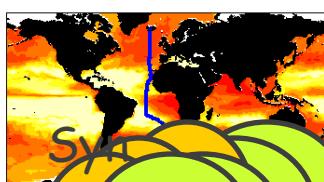

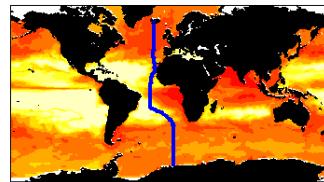

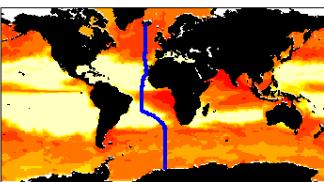

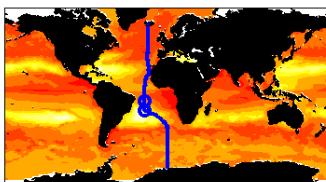

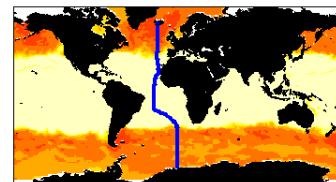

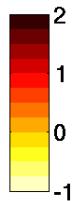

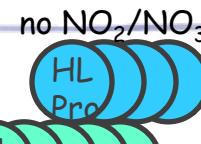

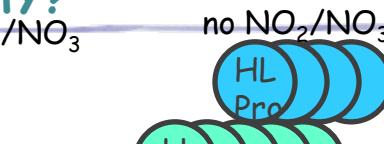

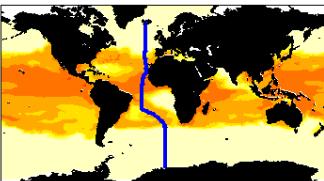

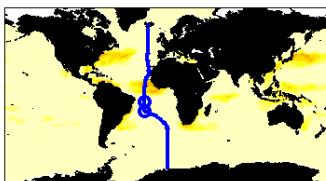

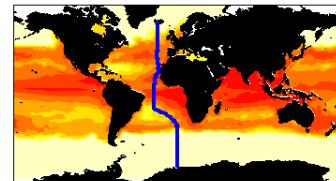

Modeling phytoplankton traits, trade-offs and biogeography

Biogeography: Where do *Prochlorococcus* live?

Why do they live there?

What traits are important for setting the biogeography?
(are all traits created equal?)

WHICH TRAITS LEAD TO DIAZOTROPH BIOGEOGRAPHY?

Size:
lowest R*

Pigment:
bluest waters

Size:
lowest R*;
and grazing

N aquisition:
least problem
in biogeo area

Warm adapted:
biogeo area is
warm

"First Order" trait:

Size - best competitor for resources in stable environment

How to reduce size?

Loss of genes for least needed "traits"

- additional pigment
- NO₃ assimilation

WHICH TRAITS IMPORANT?

How many traits are needed to explain biogeography?

Which/How many are “first order” traits?

- different for different functional groups?
(e.g. diazotrophs: Dutkiewicz et al 2012)

Are some traits consequence of optimizing another trait?

Though “important”, which traits just follow from first order?

- care need when correlating “traits”

Modeling phytoplankton traits, trade-offs and biogeography

Other "traits and trade-offs" being explored in this model framework:

- Other pigments combinations

(see e.g. Hickman et al, MEPS 2010; Hickman poster)

- N₂ fixation (see e.g. Dutkiewicz et al, GBC, 2012; Ward et al., L+O in press)

- Size and grazing pressure

(see e.g. Ward et al, L+O 2012; Ward et al, JP, in revision)

- Trade off for calcification (Fanny Monteiro)

- Zooplankton traits (Fi Prowe)
